1 Have you...

1.1 tried...

- **Reading the problem once more?**
- doubting “obvious” things?
- writing obvious things?
- radical greedy approach?
- thinking in reverse direction?
- a greedy algorithm?
- network flow when your greedy algorithms stuck?
- a dynamic programming?
- checking the range of answer?
- random algorithm?
- graph modeling using states?
- inverting state only on odd indexes?
- calculating error bound on a real number usage?

1.2 checked...

- **you have read the statement correctly?**
- typo copying the team note?
- initialization on multiple test case problem?
- additional information from the problem?
- undefined behavior?
- overflow?
- function without return value?
- real number error?
- implicit conversion?
- comparison between signed and unsigned integer?

1.3 Geometry?

- 1 point? 2 points? line? 3 or more points on a line?
- parallel line? points on line? circle?
- degenerate case? endpoints of segment?

2 Algorithmic Idea Note

When you don’t have any ideas, please brute force it.

}
```

3 Math

3.1 Tips for Inequality with Rational Number

Let A, B, x, n be integer, and operator $'/'$ means floor division (quotient).

$$Ax \leq B \Leftrightarrow x \leq B/A$$

$$Ax < B \Leftrightarrow x \leq (B-1)/A$$

$$Ax \geq B \Leftrightarrow x \geq (B+A-1)/A$$

$$Ax > B \Leftrightarrow x \geq B/A + 1$$

$$x < n \Leftrightarrow x + 1 \leq n$$

3.2 Equations

$$ax^2 + bx + c = 0 \Rightarrow x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

The extremum is given by $x = -b/2a$.

$$\begin{aligned} ax + by &= e & x &= \frac{ed - bf}{ad - bc} \\ cx + dy &= f & y &= \frac{af - ec}{ad - bc} \end{aligned}$$

In general, given an equation $Ax = b$, the solution to a variable x_i is given by

$$x_i = \frac{\det A'_i}{\det A}$$

where A'_i is A with the i 'th column replaced by b .

3.3 Inequality

For positive a, b, c, d with $\frac{a}{b} < \frac{c}{d}$, $\frac{a}{b} < \frac{a+c}{b+d} < \frac{c}{d}$ hold.

Also, for positive a, b, c, d , $\min(\frac{a}{b}, \frac{c}{d}) \leq \frac{a+c}{b+d} \leq \max(\frac{a}{b}, \frac{c}{d})$.

e.g., for two sets of disjoint vertices A, B of G ,

$$\begin{aligned} \min\left(\frac{E(G[A])}{V(G[A])}, \frac{E(G[B])}{V(G[B])}\right) &\leq \frac{E(G[A \cup B])}{V(G[A \cup B])} = \frac{E(G[A]) + E(G[B])}{V(G[A]) + V(G[B])} \\ &\leq \max\left(\frac{E(G[A])}{V(G[A])}, \frac{E(G[B])}{V(G[B])}\right) \end{aligned}$$

(therefore, the average degree of the disjoint set is larger when we divide them.)

3.4 Recurrences

If $a_n = c_1 a_{n-1} + \dots + c_k a_{n-k}$, and $r_1, \dots, r_k$ are distinct roots of $x^k - c_1 x^{k-1} - \dots - c_k$, there are $d_1, \dots, d_k$ s.t.

$$a_n = d_1 r_1^n + \dots + d_k r_k^n.$$

Non-distinct roots r become polynomial factors, e.g. $a_n = (d_1 n + d_2) r^n$.

3.5 Trigonometry

$$\sin(v + w) = \sin v \cos w + \cos v \sin w$$

$$\cos(v + w) = \cos v \cos w - \sin v \sin w$$

$$\tan(v + w) = \frac{\tan v + \tan w}{1 - \tan v \tan w}$$

$$\sin v + \sin w = 2 \sin \frac{v+w}{2} \cos \frac{v-w}{2}$$

$$\cos v + \cos w = 2 \cos \frac{v+w}{2} \cos \frac{v-w}{2}$$

$$(V + W) \tan(v - w)/2 = (V - W) \tan(v + w)/2$$

where V, W are lengths of sides opposite angles v, w .

$$a \cos x + b \sin x = r \cos(x - \phi)$$

$$a \sin x + b \cos x = r \sin(x + \phi)$$

where $r = \sqrt{a^2 + b^2}$, $\phi = \text{atan2}(b, a)$.

3.6 Geometry

3.6.1 Spherical coordinates

$$\begin{aligned} x &= r \sin \theta \cos \phi & r &= \sqrt{x^2 + y^2 + z^2} \\ y &= r \sin \theta \sin \phi & \theta &= \arccos(z / \sqrt{x^2 + y^2 + z^2}) \\ z &= r \cos \theta & \phi &= \text{atan2}(y, x) \end{aligned}$$

3.6.2 Triangles

Semiperimeter $s = \frac{a+b+c}{2}$; Area $A = \sqrt{s(s-a)(s-b)(s-c)}$

$$R = \frac{abc}{4A}; r = \frac{A}{s}; m_a = \frac{1}{2}\sqrt{2b^2 + 2c^2 - a^2}$$

$$s_a = \sqrt{bc \left[1 - \left(\frac{a}{b+c} \right)^2 \right]}$$

$$2R = \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C}$$

$$a = b \cos C + c \cos B; a^2 = b^2 + c^2 - 2bc \cos A; \frac{a+b}{a-b} = \frac{\tan \frac{\alpha+\beta}{2}}{\tan \frac{\alpha-\beta}{2}}$$

3.6.3 Quadrilaterals

With side lengths a, b, c, d , diagonals e, f , diagonals angle θ , area A and magic flux $F = b^2 + d^2 - a^2 - c^2$:

$$4A = 2ef \sin \theta = F \tan \theta = \sqrt{4e^2 f^2 - F^2}$$

For cyclic quadrilaterals the sum of opposite angles is 180° , $ef = ac + bd$, and $A = \sqrt{(p-a)(p-b)(p-c)(p-d)}$.

3.7 Derivatives/Integrals

$$\frac{d}{dx} \arcsin x = \frac{1}{\sqrt{1-x^2}}$$

$$\frac{d}{dx} \arccos x = -\frac{1}{\sqrt{1-x^2}}$$

$$\frac{d}{dx} \tan x = 1 + \tan^2 x$$

$$\frac{d}{dx} \arctan x = \frac{1}{1+x^2}$$

$$\int \tan ax = -\frac{\ln |\cos ax|}{a}$$

$$\int x \sin ax = \frac{\sin ax - ax \cos ax}{a^2}$$

$$\int e^{-x^2} = \frac{\sqrt{\pi}}{2} \operatorname{erf}(x)$$

$$\int x e^{ax} dx = \frac{e^{ax}}{a^2} (ax - 1)$$

Integration by parts:

$$\int_a^b f(x)g(x)dx = [F(x)g(x)]_a^b - \int_a^b F(x)g'(x)dx$$

3.8 Sums

$$c^a + c^{a+1} + \dots + c^b = \frac{c^{b+1} - c^a}{c - 1}, c \neq 1$$

$$1 + 2 + 3 + \dots + n = \frac{n(n+1)}{2}$$

$$1^2 + 2^2 + 3^2 + \dots + n^2 = \frac{n(2n+1)(n+1)}{6}$$

$$1^3 + 2^3 + 3^3 + \dots + n^3 = \frac{n^2(n+1)^2}{4}$$

$$1^4 + 2^4 + 3^4 + \dots + n^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}$$

3.9 Series

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots, (-\infty < x < \infty)$$

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots, (-1 < x \leq 1)$$

$$\sqrt{1+x} = 1 + \frac{x}{2} - \frac{x^2}{8} + \frac{2x^3}{32} - \frac{5x^4}{128} + \dots, (-1 \leq x \leq 1)$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots, (-\infty < x < \infty)$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots, (-\infty < x < \infty)$$

3.10 Probability theory

Let X be a discrete random variable with probability $p_X(x)$ of assuming the value x . It will then have an expected value (mean) $\mu = \mathbb{E}(X) = \sum_x x p_X(x)$ and variance $\sigma^2 = V(X) = \mathbb{E}(X^2) - (\mathbb{E}(X))^2 = \sum_x (x - \mathbb{E}(X))^2 p_X(x)$ where σ is the standard deviation. If X is instead continuous it will have a probability density function $f_X(x)$ and the sums above will instead be integrals with $p_X(x)$ replaced by $f_X(x)$.

Expectation is linear:

$$\mathbb{E}(aX + bY) = a\mathbb{E}(X) + b\mathbb{E}(Y)$$

For independent X and Y ,

$$V(aX + bY) = a^2 V(X) + b^2 V(Y).$$

3.10.1 Binomial distribution

The number of successes in n independent yes/no experiments, each which yields success with probability p is $\text{Bin}(n, p)$, $n = 1, 2, \dots$, $0 \leq p \leq 1$.

$$p(k) = \binom{n}{k} p^k (1-p)^{n-k}$$

$$\mu = np, \sigma^2 = np(1-p)$$

$\text{Bin}(n, p)$ is approximately $\text{Po}(np)$ for small p .

3.10.2 First success distribution

The number of trials needed to get the first success in independent yes/no experiments, each which yields success with probability p is $\text{Fs}(p)$, $0 \leq p \leq 1$.

$$p(k) = p(1-p)^{k-1}, k = 1, 2, \dots$$

$$\mu = \frac{1}{p}, \sigma^2 = \frac{1-p}{p^2}$$

3.10.3 Poisson distribution

The number of events occurring in a fixed period of time t if these events occur with a known average rate κ and independently of the

time since the last event is $\text{Po}(\lambda)$, $\lambda = t\kappa$.

$$p(k) = e^{-\lambda} \frac{\lambda^k}{k!}, k = 0, 1, 2, \dots$$

$$\mu = \lambda, \sigma^2 = \lambda$$

3.10.4 Exponential distribution

The time between events in a Poisson process is $\text{Exp}(\lambda)$, $\lambda > 0$.

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & x \geq 0 \\ 0 & x < 0 \end{cases}$$

$$\mu = \frac{1}{\lambda}, \sigma^2 = \frac{1}{\lambda^2}$$

3.11 Prime Number

3.11.1 Distribution of Prime Number

1e2	25	1e6	78,498	1e10	<5e8
1e3	168	1e7	664,579	1e11	<5e9
1e4	1,229	1e8	<6e6	1e12	<4e10
1e5	9,592	1e9	<6e7	1e13	<4e11

3.11.2 Prime Gap

$$2 \cdot 10^5 \text{ 이하의 소수 간극} \leq 100$$

$$2^{32} \text{ 이하의 소수 간극} \leq 464$$

$$2^{64} \text{ 이하의 소수 간극} \leq 1550$$

3.12 Miller-Rabin Algorithm

Usage: `is_p(X)` : returns true if X is prime, otherwise false.

When $X \leq 2^{32}$, $D = \{2, 7, 61\}$ is sufficient;

$X \leq 2^{64}$, $D = \{p|p \text{ is prime}, p \leq 37\}$ is sufficient.

Time Complexity: $\mathcal{O}(\log^3 X)$

```

ll pow(ll a, ll b, ll mod) {
    ll ret = 1;
    for(int st=0; (1LL<<st) <= b; st++) {
        if((1LL<<st) & b) ret=(1ll)ret*a%mod;
        a=(1ll)a*a%mod;
    }
}
```

```

}
return ret;
}
bool miller(ll n, ll a) {
    if(n == a) return true;
    ll x = n-1;
    if(pow(a, x, n) != 1) return false;
    while(x%2==0) {
        x/=2;
        ll t = pow(a, x, n);
        if(t!=1 and t!=n-1) return false;
        if(t==n-1) return true;
    }
    return true;
}
bool is_p(ll n) {
    if(n<=2) return n==2;
    vi D = {2, 3, 5, 7, 11, 13, 17, 23, 29, 31, 37};
    for(auto i:D) if(!miller(n, i)) return false;
    return true;
}
}
```

3.13 Pollad Rho Algorithm

Usage: `po_rho(N)` : returns array of prime factors of X .

Time Complexity: $\mathcal{O}(N^{1/4})$

```

void fact(ll n, vl& ret) {
    if(n == 1) return;
    else if(n%2 == 0) ret.pb(2), fact(n/2, ret);
    else if(is_p(n)) ret.pb(n);
    else {
        ll a, b, c, g = n;
        auto f = [&c, &n](ll x)->ll{return (c+(1ll)x*x)%n;};

        do {
            if(g == n) a=b=rand()%(n-2)+2, c=rand()%20+1;
            a=f(a); b=f(f(b));
            g = gcd(a-b, n);
        } while(g == 1);
        fact(g, ret); fact(n/g, ret);
    }
}
```

```

}
vl po_rho(ll n) {
    vl ret;
    fact(n, ret);
    sort(all(ret));
    return ret;
}

3.14 Primitive Root

Usage: Calculate one of the primitive roots of given prime.
random_device rd; mt19937 rng(rd());

ll primary_root(ll p) {
    uniform_int_distribution<ll> dist(1, p-1);
    auto gen = bind(dist, rng);

    vl g = po_rho(p-1);
    while(true) {
        ll c = gen(), u = p-1, b = 1;
        bool ok = true;

        for(auto i:g) {
            if(i != b) u = p-1;
            ll x = pow(c, u/i, p);
            if(x == 1) ok = false;
            u /= i; b = i;
        }

        if(ok) return c;
    }
}
```

3.15 Diopantos Equation(Extended Euclidian Algorithm)

Usage: `diophantos(a, b)` : return one integer solution of $ax+by = 1$, satisfying $0 \leq x < b$.

Time Complexity: $\mathcal{O}(\log(\max(a, b)))$

```

pll diophantos(ll a, ll b) {
    assert(a>0 and b>=0);
    if(b == 0) return {1, 0};
}
```

```

auto [y, x] = diophantos(b, a%b); y = y-(a/b)*x;
if(x < 0 or x >= b) {
    ll t = x/b;
    if(x%b < 0) t--;

    x -= b*t; y += a*t;
}
return {x, y};
}

```

3.16 Chinese Remainder Theorem

Usage: crt(p11 p, p11 q) : return p11 r, satisfying follows:

$$\begin{aligned}
 x &\equiv p.fi \pmod{p.se} \\
 \text{and } x &\equiv q.fi \pmod{q.se} \\
 \Leftrightarrow x &\equiv r.fi \pmod{r.se}
 \end{aligned}$$

If there's no such r, return $\{-1, -1\}$.

Time Complexity: $\mathcal{O}(\log A)$

```

p11 crt(p11 p, p11 q) {
    if(p.fi > q.fi) swap(p, q);
    auto [a, A] = p;
    auto [b, B] = q;

    ll g = gcd(A, B);
    if((b-a)%g != 0) return {-1, -1};

    ll i = A, j = B, k = b-a;
    i/=g; j/=g; k/=g;
    auto [x, y] = diophantos(i, j);
    return {(ll)((a+(lll)A*k*x)%(A*B/g)), A*B/g};
}

```

3.17 Harmonic Lemma

Usage: f(N) : return the value

$$\sum_{i=1}^N \left\lfloor \frac{N}{i} \right\rfloor = \left\lfloor \frac{N}{1} \right\rfloor + \left\lfloor \frac{N}{2} \right\rfloor + \cdots + \left\lfloor \frac{N}{N} \right\rfloor$$

Using the fact that $\left\lfloor \frac{N}{x} \right\rfloor$ has $\mathcal{O}(\sqrt{N})$ different values.

Time Complexity: $\mathcal{O}(\sqrt{N})$

```

ll harmonic(ll n) {
    ll ans = 0;
    for(ll i = 1; i <= n; i = n/(n/i)+ 1) {
        //for j \in [i, n/(n/i)] : n/j == n/i

        ans += n/i * (n/(n/i) - i + 1);

        // \sum_{i=1}^n {f(n/i)}
        // ans += f(n/i) * (n/(n/i) - i + 1)
    }
    return ans;
}

```

3.18 Floor Sum (Sum of Floor of Rational Arithmetic Sequence)

Usage: floor_sum(A, B, C, N) : return the value

$$\sum_{x=0}^{N-1} \left\lfloor \frac{Ax+B}{C} \right\rfloor$$

Time Complexity: $\mathcal{O}(\log N)$

```

ll floor_sum(ll a, ll b, ll c, ll n)
{
    if(a == 0) return b/c*n;
    if(a>=c or b>=c) return n*(n-1)/2 * (a/c) + n * (b/c) +
    floor_sum(a%c, b%c, c, n);
    ll m = (a*(n-1)+b)/c;
    return m*n - floor_sum(c, c-b+a-1, a, m);
}

```

3.19 FFT - Convolution

Time Complexity: $\mathcal{O}(N \log N)$

```

using cpx = complex<double>;
using vcp = vector<cpx>;
void fft(vcp &a, bool inv = false) {
    int n = a.size(), j = 0; assert((n&n) == n);

3.22 Combinatorics

3.22.1 Labeled Combinatorial Target

- Permutation, Combination (with, w/o repetition)

– Permutation ${}_nP_r = \frac{n!}{r!(n-r)!}$

- Combination ${}_nC_r = \binom{n}{r} = \frac{n!}{r!}$
- Permutation with repetition ${}_n\Pi_r = n^r$
- Combination with repetition ${}_nH_r = {}_{n+r-1}C_r$

- Catalan Number C_n : the number of regular bracket string of length $2n$.

- $C_n = \frac{1}{n+1} \binom{2n}{n}$
- $C_n : 1, 1, 2, 5, 14, 42, 132, 429, 1430, \dots$ (from index 0)
- OGF of $C_n : c(x) = 1 + xc(x)^2, c(c) = \frac{1-\sqrt{1-4x}}{2x}$
- Catalan's triangle $C(n, k)$: the number of string with n X's, k Y's, where the number of Y's is not greater than the number of X's when written down the string.
 - * i.e. $C(4, 3) : \text{XXXXYYYY, XXYXYYXX are OK, but XXYYYXX is not OK.}$
 - * $C(n, k) = \binom{n+k}{k} - \binom{n+k}{k-1} = \frac{n-k+1}{n+1} \binom{n+k}{k}$
 - * We can give the condition relax : $C_m(n, k)$: the number of string with n X's, k Y's, where the number of Y's is not greater than (the number of X's) + m when written down the string.
 - * $C_m(n, k) = \binom{n+k}{k} - \binom{n+k}{k-m}$ when $m \leq k \leq n+m-1$.
 - * $C_1(n, k) = C(n, k)$

- Derangement (교란순열) D_n : the number of permutation of length n which $\forall i, p_i \neq i$.

- $D_n : 1, 0, 1, 2, 9, 44, 265, 1854, 14833, 133496, 1334961 \dots$ (from index 0)
- EGF of $D_n : D(x) = \sum_{n=0} \frac{D_n}{n!} x^n = \frac{e^{-x}}{1-x}$

- Stirling Number of the 1st/2nd kind.

- Unsigned Stirling Number of the 1st kind $c(n, k) = \left[\begin{smallmatrix} n \\ k \end{smallmatrix} \right]$: the number of permutation of length n with k disjoint cycles.

- * $c(n+1, k) = n \times c(n, k) + c(n, k-1)$
- * with boundary condition $c(0, 0) = 1, c(n, 0) = c(0, k) = 0 \forall n, k > 0$
- * $c(n, k)$
 - $c(0, 0) = 1; c(x \neq 0, 0) = 0; c(x, x) = 1$
 - $c(x, x) = 1$

· $c(5, *) = \{0, 24, 50, 35, 101\}$

· $c(6, *) = \{0, 120, 274, 225, 85, 15, 1\}$

- * OGF of $\left[\begin{smallmatrix} n \\ k \end{smallmatrix} \right]$: for fixed n , $\sum_{k=0}^n \left[\begin{smallmatrix} n \\ k \end{smallmatrix} \right] x^k = x(x+1)(x+2) \dots (x+n-1)$: we can calculate it by polynomial shift & divide and conquer

* EGF of $\left[\begin{smallmatrix} n \\ k \end{smallmatrix} \right]$: for fixed k , $\sum_{n=k}^{\infty} \left[\begin{smallmatrix} n \\ k \end{smallmatrix} \right] \frac{x^n}{n!} = \frac{(-\log(1-z))^k}{k!}$

* Signed Stirling Number of the 1st kind $s(n, k) = (-1)^{n-k} c(n, k)$

* EGF of $s(n, k)$: for fixed k , $\sum_{n=k}^{\infty} s(n, k) \frac{x^n}{n!} = \frac{(\log(1+z))^k}{k!}$

- Stirling Number of the 2nd kind $S(n, k) = \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\}$: the number of partition of n labeled objects into k nonempty unlabelled subsets.

* $S(n, k) = \frac{1}{k!} \sum_{i=0}^k (-1)^{k-i} \binom{k}{i} i^n$

* $S(n, k) = S(n-1, k-1) + k \cdot S(n-1, k)$

* $S(n, k)$

· $S(0, 0) = 1; S(x \neq 0, 0) = 0; S(x, x) = 1$

· $S(5, *) = \{0, 1, 15, 25, 10, 1\}$

· $S(6, *) = \{0, 1, 31, 90, 65, 15, 1\}$

- * OGF of $\left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\}$: for fixed n , $\sum_{k=0}^n \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\} x^k = T_n(x)$, where $T_n(x) = e^{-x} \sum_{k=0}^{\infty} \frac{k^n}{k!} x^k$ is Touchard Polynomials.

* EGF of $\left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\}$: for fixed k , $\sum_{n=k}^{\infty} \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\} \frac{x^n}{n!} = \frac{(e^x - 1)^k}{k!}$

- Bell Number B_n : the number of partition of set with size n .

- i.e. partitionize $\{a, b, c\}$ is $\{\{a\}, \{b\}, \{c\}\}, \{\{a, b\}, \{c\}\}, \{\{b, c\}, \{a\}\}, \{\{c, a\}, \{b\}\}, \{\{a, b, c\}\}$. Therefore, $B_3 = 5$.

– $B_n : 1, 1, 2, 5, 15, 52, 203, 877, 4140, \dots$ (from index 0)

– $B_n = \sum_{k=0}^n \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\}$ (2nd kind of stirling number)

– EGF of $B_n : B(x) = \sum_{n=0} \frac{B_n}{n!} x^n = e^{e^x - 1}$

- Ordered Bell Number (Fubini Number) a_n : the number of distinct weak ordering on a set of n elements.

* $a_n : 1, 1, 3, 13, 75, 541, 4683, 47293, 545835, 7087261, \dots$

* $a_n = \sum_{k=0}^n k! \left\{ \begin{smallmatrix} n \\ k \end{smallmatrix} \right\}$ (stirling number of the 2nd kind)

* EGF of $a_n : a(x) = \sum_{n=0}^{\infty} \frac{a_n}{n!} x^n = \frac{1}{2-e^x}$

- Integer Partition $P(n, k)$: the number of partitions of n into exactly k parts.

– i.e. $P(4, 2) = 2$ since $4 = 1 + 3 = 2 + 2$

– we also say $P(n) = \sum_{k=1}^n P(n, k)$

– $P(n, k)$

$$* P(x, 1) = P(x, x) = 1$$

$$* P(8, *) = \{1, 4, 5, 5, 3, 2, 1, 1\}$$

$$* P(9, *) = \{1, 4, 7, 6, 5, 3, 2, 1, 1\}$$

– $P(n) = \{1, 2, 3, 5, 7, 11, 15, 22, 30, 42\}$

- 12정도(the Twelfold Way) : the number of functions

(Domain $|N| = n$, Codomain $|X| = x$)

$$\text{Recurrence : } D[i][j] = \min_{i \leq k < j} (D[i][k] + D[k+1][j]) + C[i][j]$$

Condition : $C[i][j]$ is Monge &

$C[a][d] \geq C[b][c]$ for $a \leq b \leq c \leq d$

Complexity : $\mathcal{O}(N^3) \rightarrow \mathcal{O}(N^2)$

구간에 대해 동적 계획법(DP)을 수행할 때, 다음과 같은 점화식이 있다고 가정합니다:

$$a[i][j] = \min_{i < k < j} (a[i][k] + a[k][j]) + f(i, j)$$

여기서 (최소화된) 최적의 k 가 i 와 j 모두에 대해 증가한다고 하면, 구간의 길이에 따라 DP를 계산하며 $a[i][j]$ 에 대해 $k = p[i][j]$ 를 $p[i][j-1]$ 부터 $p[i+1][j]$ 사이에서만 탐색하면 됩니다.

7.1.5 Aliens Trick (Lagrangian relaxation)

$$\text{Recurrence : } D[k][i] = \min_{j < i} (D[k-1][j] + C[j+1][i])$$

Condition : $D[x][N]$ is convex (is implied when $C[i][j]$ is Monge)

$$(f(x+1) - f(x) \leq f(x+2) - f(x+1))$$

Complexity : $\mathcal{O}(KN^2) \rightarrow \mathcal{O}(N^2 \log |W|)$

7.1.6 Slope Trick

13323 BOJ 수열 1/2. 수열 A가 주어진다. 증가수열 B에 대해, $\sum_{i=1}^N |A_i - B_i|$ 를 최소화하고, 그 B를 찾아라.

```
const int N = 1e6+7;
int arr[N];
priority_queue<int> pq;
ll ans = 0;
int main()
{
    getint(n);
    forr(i, n) scanf("%d", arr+i);

    pq.push(arr[1]); int t=0; ll val = 0;
    forr(i, 2, n)
    {
        t++;
        int r = t + pq.top();
        if(r <= arr[i]) pq.push(arr[i]-t);
        else
        {
            pq.push(arr[i]-t); pq.push(arr[i]-t); pq.pop();
            ans += r-arr[i];
        }
    }

    printf("%lld", ans);
}
```

```
int arr[N];
priority_queue<int> pq;
int ans2[N];
int main()
{
    getint(n);
    forr(i, n) scanf("%d", arr+i);

    pq.push(arr[1]); ll ans = 0;
    ans2[1] = arr[1];
    forr(i, 2, n)
    {
        int r = (i-1) + pq.top();
        if(r <= arr[i]) pq.push(arr[i]-(i-1));
        else
        {
            pq.push(arr[i]-(i-1)); pq.push(arr[i]-(i-1));
            pq.pop();
            ans += r-arr[i];
        }

        ans2[i] = pq.top() + (i-1);
    }

    fore(i, n-1, 1) ans2[i] = min(ans2[i], ans2[i+1]-1);
    forr(i, n) printf("%d\n", ans2[i]);
}
```

7.2 LineContainer

Time Complexity: $\mathcal{O}(\log N)$

```
struct Line {
    mutable ll k, m, p;
    bool operator<(const Line& o) const { return k < o.k; }
    bool operator<(ll x) const { return p < x; }
};

struct LineContainer : multiset<Line, less<>> {
    // (for doubles, use inf = 1/.0, div(a,b) = a/b)
    static const ll inf = LLONG_MAX;
```

```

11 div(ll a, ll b) { // floored division
    return a / b - ((a ^ b) < 0 && a % b); }
bool isect(iterator x, iterator y) {
    if (y == end()) return x->p = inf, 0;
    if (x->k == y->k) x->p = x->m > y->m ? inf : -inf;
    else x->p = div(y->m - x->m, x->k - y->k);
    return x->p >= y->p;
}
void add(ll k, ll m) {
    auto z = insert({k, m, 0}), y = z++, x = y;
    while (isect(y, z)) z = erase(z);
    if (x != begin() && isect(--x, y)) isect(x, y = erase(y));
    while ((y = x) != begin() && (--x)->p >= y->p)
        isect(x, erase(y));
}
11 query(ll x) {
    assert(!empty());
    auto l = *lower_bound(x);
    return l.k * x + l.m;
}
};

```

7.3 SoS(Some over Subsets)

Time Complexity: $\mathcal{O}(N \cdot 2^N)$

```

int n = 20;
vector<int> a(1 << n);

// keeps track of the sum over subsets
// with a certain amount of matching bits in the prefix
vector<vector<int>> dp(1 << n, vector<int>(n));

vector<int> sos(1 << n);
for (int mask = 0; mask < (1 << n); mask++) {
    dp[mask][0] = a[mask];
    for (int x = 0; x < n; x++) {
        dp[mask][x] = dp[mask][x - 1];
        if (mask & (1 << x)) { dp[mask][x] += dp[mask - (1 << x)][x - 1]; }
    }
}

```

```

    sos[mask] = dp[mask][n - 1];
}

////////////////////
D[i]에 미리 i에 해당하는 값을 넣어둔다
for(d, 0, 19) for(i, 0, (1<<20)-1)
    if(i & (1<<d)) D[i] += D[i^(1<<d)];
-> D[i] : sum of subset of mask i

```

8 String

8.1 KMP

```

int fail[N]; // N : s의 최대 길이
vi kmp(char obj[], char s[]) {
    vi ret;
    for(int i = 1, j = 0; s[i]; i++) {
        fail[i] = 0;
        while(j > 0 and s[i] != s[j]) j = fail[j-1];
        if(s[i] == s[j]) fail[i] = ++j;
    }
    for(int i = 0, j = 0; obj[i]; i++) {
        while(j > 0 and obj[i] != s[j]) j = fail[j-1];
        if(obj[i] == s[j]) {
            if(s[j+1]) j++;
            else ret.push_back(i-j), j = fail[j];
        }
    }
    return ret;
}

```

8.2 F, Z, M, SA(Suffix Array), LCP(Longest Common Prefix)

Usage: For string s(1-indexed) of length N;

$F[i]$ = maximum $k < i$ s.t. $s[1 \dots k] = s[i - k + 1 \dots i]$
 $Z[i]$ = maximum k s.t. $s[1 \dots k] = s[i \dots i + k - 1]$
 $M[i]$ = maximum k s.t. $s[i - k + 1 \dots i + k - 1]$ is palindrom.
 $SA[i] = k$ s.t. $s[k \dots N]$ is the i^{th} smallest of $\{s[1 \dots N], s[2 \dots N], \dots, s[N \dots N]\}$
 $LCP[i] = \text{maximum } k$ s.t. $s[SA[i - 1] \dots SA[i - 1] + k - 1] = s[SA[i] \dots SA[i] + k - 1]$

Time Complexity: $\mathcal{O}(N), \mathcal{O}(N), \mathcal{O}(N), \mathcal{O}(N \log N), \mathcal{O}(N)$, respectively

```

const int N = 1e5+7;
char s[N];
int F[N], Z[N], M[N];
int sa[N]; int ord[N], tmp[N], cnt[N];
int lcp[N];

    }
}

```

8.4 Eertree

```

struct Eertree {
    int len[N], link[N], nxt[N][26], r[N];
    long long cnt[N]; int sz, last, n;
    char s[N];
    Eertree() {
        memset(nxt, 0, sizeof(nxt));
        memset(cnt, 0, sizeof(cnt));
        s[0] = -1;
        n = 0; sz = 2; last = 1;
        len[0] = -1; link[0] = 0;
        len[1] = 0; link[1] = 0;
    }
    int get_link(int v) {
        while (s[n-len[v]-1] != s[n]) v = link[v];
        return v;
    }
    void insert(char c) {
        s[++n] = c;
        int cur = get_link(last);
        if (!nxt[cur][c-'a']) {
            int now = sz++;
            r[now] = n;
            len[now] = len[cur] + 2;
            if (len[now] == 1) link[now] = 1;
            else link[now] =
                nxt[get_link(link[cur])][c-'a'];
            nxt[cur][c-'a'] = now;
        }
        last = nxt[cur][c-'a'];
        cnt[last]++;
    }
    void propagate() { for(i, sz-1, 2) cnt[link[i]] +=
        cnt[i]; }
};

```

```

Eertree et; forr(i, n) et.insert(s[i]);
int m = et.sz; et.propagate();
for(i, 2, m-1) ans = max(ans, et.cnt[i] * et.len[i]);
// node i : s[(et.r[i]-et.len[i]+1)~(et.r[i])]
// distinct count of pal : m-2; count of node i : et.cnt[i];

```

9 Graph

9.1 SCC - Tarjan Algorithm

Usage: scn[i] : SCC number of node i , nsc : the number of SCCs

```

vi adj[N];
int in[N], c = 0;
stack<int> p;
bool fin[N]; int scn[N], nsc = 0;
int dfs(int s) {
    in[s] = ++c;
    p.push(s);

    int m = c;
    for(auto i : adj[s]) {
        if(in[i] == 0) m = min(m, dfs(i));
        else if(!fin[i]) m = min(m, in[i]);
    }

    if(m == in[s]) {
        nsc++;
        while(p.top() != s)
        {
            int i = p.top(); p.pop();
            scn[i] = nsc; fin[i] = true;
        }
        p.pop();
        scn[s] = nsc; fin[s] = true;
    }
    return m;
}

forr(i, n) if(!fin[i]) dfs(i);

```

9.1.1 2-SAT

Usage: For all $(x|y)$ clause, make the edge from $!x$ to y , and from $!y$ to x , and then find the SCC from graph. Check whether for all x , x and $!x$ are not in the same SCC. To reconstruct the 2-SAT, make it false for x or make it true for $!x$ if we can, in decreasing order of scn.

```

ok = true; // 1<=i&&i<=n : $x$, n+1<=i&&i<=2*n : !$x$
forr(i, n) {
    if (scn[i] == scn[i+n]) ok = false;
    ans[i] = (scn[i] < scn[i+n]);
}

```

9.2 Bipartite Matching - with DFS

Usage: Let's say that graph is bipartite. And Let's say that one group is A , and the other graph is B . $|A| = N$, $|B| = M$. **matching**($c = s$) : add one matching from $s \in A$. If successfully matched, return true; otherwise return false. **selby**[i] = store $s \in A$, s.t. $i \in B$ is matched with s .

(e.g.) forr(i, n) ans += matching($c=i$);

Time Complexity: $\mathcal{O}(VE)$

```

vector<int> sideadj[N];
int selby[M];
int chk[M], c;
bool matching(int s) {
    for(auto i : sideadj[s]) {
        if(chk[i] == c) continue;
        chk[i] = c;
        if(selby[i] and !matching(selby[i])) continue;
        selby[i] = s;
        return true;
    }
    return false;
}

```

9.2.1 Hall's Marriage Theorem

For some bipartite graph $G = (A \cup B, E)$, G has perfect matching if and only if for every $S \subseteq A$, $|N_G(S)| \geq |S|$ holds.

9.2.2 Minimum Vertex Cover on Bipartite Graph(König's Theorem)

On bipartite graph,

$$|\text{Minimum Vertex Cover}| = |\text{Maximum Matching}|$$

To find Minimum Vertex Cover, (Should be **added**.)

9.2.3 Maximum Independent Set on Bipartite Graph

On bipartite graph,

$$|\text{Maximum Independent Set}| = |V| - |\text{Maximum Matching}|$$

* Note : Complement of the Vertex Cover is the Independent Set.

9.2.4 Minimum Path Cover on DAG

Let's think about the bipartite graph, with vertex set A and B, satisfying follow property:

- If there's edge from node i to node j on DAG, then there's edge connecting i^{th} node of A and j^{th} node of B, and vice versa.

Then following holds:

$$|\text{Minimum Path Cover of DAG}| = |\text{Maximum Matching on Bipartite Graph}|$$

9.2.5 Maximum Antichain on DAG(Dilworth's Theorem)

On DAG,

$$|\text{Minimum Path Cover}| = |\text{Maximum Antichain}|$$

9.3 Dominator Tree

Usage: For directed graph $G = (V, E)$ and some vertex $s \in V$ which can reach every vertex in V , u is domonator of v iff $u \neq v$ and every path from s to v must go through u . Dominator tree is the tree that connects $\text{idom}(v)$ (Immediate Dominator) and v .

// <https://ideone.com/a06cH4>

```
namespace dtree{ // by cki86201
```

```

9.5 MCMF - with SPFA

Usage: Construct graph with connect(from, to, capacity,
cost);. Find the maximum flow and corresponding minimum cost
from S to T with flow(S, T);.

Time Complexity:  $\mathcal{O}(VEf)$ , but it works like magic.

struct Edge {
    int to, cap, now;
    ll cost;
    Edge* rev;
    Edge(int to,int cap, ll cost)
        :to(to), cap(cap), now(0), cost(cost){}
    int left(){return cap - now;}
    ll flow(int f)
        {now += f; rev->now -= f; return cost * f;}
    void reset(){now = 0;}
};

            now = hist[now]->rev->to;
        }
        now = T;
        while(S != now) {
            cost += hist[now]->flow(m);
            now = hist[now]->rev->to;
        }
        ans += m;
    }
    return {ans, cost};
}

```

9.6 General Matching

Usage: We can use Tutte matrix. First, select arbitrary prime p .

Second, construct $T_{i,j} = \begin{cases} r_{i,j} & \text{if } (i,j) \in E \text{ and } i < j \\ -r_{j,i} & \text{if } (i,j) \in E \text{ and } i > j, \text{ with } r_{i,j} \text{ be} \\ 0 & \text{otherwise} \end{cases}$

the random integer in $[1, p-1]$. After construct T , the maximum size of G is $\text{rank}(T)/2$ with high probability.

If we want the result of matching, use:

Time Complexity: $O(n^3)$

```
// Originate from https://github.com/koosaga/olympiad
// matching_short.cpp / 1-based Vertex index / const int N =
2020 + 1;
int vis[N], par[N], orig[N], match[N], aux[N], t, n;

```

12 Technic

12.1 Cartesian Tree

```

int A[N], par[N];
stack<int> st;
forr(i, n) {
    int l = -1;
    while(!st.empty() && A[st.top()] < A[i])
        l = st.top(), st.pop();
    if(l != -1) par[l] = i;
    if(!st.empty()) par[i] = st.top();
}

```

```

st.push(i);
}
while(st.size() != 1) st.pop();
par[st.top()] = st.top();

```

13 Misc

13.1 Negative Division on C/C++

Usage: Procedure : (1) make both dividend and divisor positive, and calc the quotient (2) decide the sign of quotient, and calc r as $a - b \times q$. Following shows the floored division, not the truncated division.

```

#define div_div
ll div(ll A, ll B) {
    ll q = A/B; if(A<0) q-=(B>0)-(B<0);
    return q;
}

```

13.2 Fast Input

Usage: Fast Input with fread. Do not use with scanf, cin, or other input function. Use `forr(i, n) read(arr[i]);` instead of `forr(i, n) scanf("%d", arr+i);`. Use `read(s+1)` instead of `scanf("%s", s+1);`.

```

#define getint(n) int n; read(n)
#define getll(n) ll n; read(n)
#define inta getint(a)
#define intab getint(a); getint(b)
char get() {
    static char buf[100000], *S=buf, *T=buf;
    if(S == T) {
        S = buf; T = buf + fread(buf, 1, 100000, stdin);
        if(S == T) return EOF;
    }
    return *S++;
}
void read(int& n) {
    n = 0; char c; bool neg = false;
    for(c = get(); c < '0'; c=get()) if(c=='-') neg = true;
}

```

```

for(;c>='0';c=get()) n = n*10+c-'0';
if(neg) n = -n;
}
void read(ll& n) {
    n = 0; char c; bool neg = false;
    for(c = get(); c < '0'; c=get()) if(c=='-') neg = true;
    for(;c>='0';c=get()) n = n*10+c-'0';
    if(neg) n = -n;
}
int read(char s[]) {
    char c; int p = 0; while((c = get()) <= ' ');
    s[p++] = c; while((c = get()) >= ' ') s[p++] = c;
    s[p] = '\0'; return p;
}

```

13.3 MT19937 Random Number

```

const long long L = 1, R = 10;

random_device rd; mt19937 rng(rd());
uniform_int_distribution<int> dist(L, R);
// discrete_distribution<int> dist({10, 30, 60}); // [0, 2]
// bernoulli_distribution dist(p); // true(p), false(1-p)
// binomial_distribution<int> dist(N, p); // # of success
// geometric_distribution<int> dist(p); // # of failure

// uniform_real_distribution<double> dist(L, R);
// normal_distribution<double> dist(mean, std);
// exponential_distribution<double> dist(lambda); // occur
time
// poisson_distribution<int> dist(lambda); // how many?
// chi_squared_distribution<double> dist(df); // 자유도

auto gen = bind(dist, rng);

gen(); gen(); gen();

```
