차 례

1 Have you...

1.1 tried...

- **Reading the problem once more?**
- doubting “obvious" things?
- writing obivous things?
- radical greedy approach?
- thinking in reverse direction?
- a greedy algorithm?
- network flow when your greedy algorithms stuck?
- a dynamic programming?
- checking the range of answer?
- random algorithm?
- graph modeling using states?
- inverting state only on odd indexes?
- calculating error bound on a real number usage?

1.2 checked...

- **you have read the statement correctly?**
- typo copying the team note?
- initialization on multiple test case problem?
- additional information from the problem?
- undefined behavior?
- overflow?
- function without return value?
- real number error?
- implicit conversion?
- comparison between signed and unsigned integer?

1.3 Geometry?

- 1 point? 2 points? line? 3 or more points on a line?
- parallel line? points on line? circle?
- degenerate case? endpoints of segment?

2 Algorithmic Idea Note

When you don’t have any ideas, please bruteforce it.

"Compile Done" && time ./solve_exefile'
```

2.2 Tips for Inequality with Rational Number

Let A, B, x, n be integer, and operator '/' means floor division(quotient).

$$Ax \leqslant B \Leftrightarrow x \leqslant B/A$$
$$Ax < B \Leftrightarrow x \leqslant (B-1)/A$$
$$Ax \geqslant B \Leftrightarrow x \geqslant (B+A-1)/A$$
$$Ax > B \Leftrightarrow x \geqslant B/A+1$$

$$x < n \Leftrightarrow x+1 \leqslant n$$

3 Math

3.1 Equations

$$ax^2+bx+c=0 \Rightarrow x = \frac{-b \pm \sqrt{b^2-4ac}}{2a}$$

The extremum is given by $x = -b/2a$.

$$\begin{matrix} ax+by=e \\ cx+dy=f \end{matrix} \Rightarrow \begin{matrix} x = \frac{ed-bf}{ad-bc} \\ y = \frac{af-ec}{ad-bc} \end{matrix}$$

In general, given an equation $Ax=b$, the solution to a variable x_i is given by

$$x_i = \frac{\det A_i'}{\det A}$$

where A_i' is A with the i'th column replaced by b.

3.2 Inequality

For positive a, b, c, d with $\frac{a}{b} < \frac{c}{d}$, $\frac{a}{b} < \frac{a+c}{b+d} < \frac{c}{d}$ hold.
Also, for positive a, b, c, d, $\min(\frac{a}{b}, \frac{c}{d}) \leqslant \frac{a+c}{b+d} \leqslant max(\frac{a}{b}, \frac{c}{d})$.
e.g., for two sets of disjoint vertices A, B of G,

$$\min\left(\frac{E(G[A])}{V(G[A])}, \frac{E(G[B])}{V(G[B])}\right) \leqslant \frac{E(G[A\cup B])}{V(G[A\cup B])} = \frac{E(G[A])+E(G[B])}{V(G[A])+V(G[B])} \leqslant \max\left(\frac{E(G[A])}{V(G[A])}, \frac{E(G[B])}{V(G[B])}\right)$$

(therefore, the average degree of the disjoint set is larger when we divide them.)

3.3 Recurrences

If $a_n = c_1 a_{n-1} + \cdots + c_k a_{n-k}$, and $r_1, \ldots, r_k$ are distinct roots of $x^k - c_1 x^{k-1} - \cdots - c_k$, there are $d_1, \ldots, d_k$ s.t.

$$a_n = d_1 r_1^n + \cdots + d_k r_k^n.$$

Non-distinct roots r become polynomial factors, e.g. $a_n = (d_1 n + d_2) r^n$.

3.4 Geometry

3.4.1 Triangles

Side lengths: a, b, c
Semiperimeter: $p = \frac{a+b+c}{2}$
Area: $A = \sqrt{p(p-a)(p-b)(p-c)}$
Circumradius: $R = \frac{abc}{4A}$
Inradius: $r = \frac{A}{p}$
Length of the median (divides the triangle into two equal area triangles): $m_a = \frac{1}{2}\sqrt{2b^2+2c^2-a^2}$
Length of the bisector (divides angles into two): $s_a = \sqrt{bc\left[1-\left(\frac{a}{b+c}\right)^2\right]}$
Law of sines: $\frac{\sin\alpha}{a} = \frac{\sin\beta}{b} = \frac{\sin\gamma}{c} = \frac{1}{2R}$
Law of cosines: $a^2 = b^2+c^2-2bc\cos\alpha$
Law of tangents: $\frac{a+b}{a-b} = \frac{\tan\frac{\alpha+\beta}{2}}{\tan\frac{\alpha-\beta}{2}}$

3.4.2 Quadrilaterals

With side lengths a, b, c, d, diagonals e, f, diagonals angle θ, area A and magic flux $F = b^2+d^2-a^2-c^2$:

$$4A = 2ef \cdot \sin\theta = F\tan\theta = \sqrt{4e^2f^2-F^2}$$

For cyclic quadrilaterals the sum of opposite angles is $180°$, $ef = ac+bd$, and $A = \sqrt{(p-a)(p-b)(p-c)(p-d)}$.

3.5 Derivatives/Integrals

$$\frac{d}{dx}\arcsin x = \frac{1}{\sqrt{1-x^2}} \qquad \frac{d}{dx}\arccos x = -\frac{1}{\sqrt{1-x^2}}$$
$$\frac{d}{dx}\tan x = 1+\tan^2 x \qquad \frac{d}{dx}\arctan x = \frac{1}{1+x^2}$$
$$\int \tan ax = -\frac{\ln|\cos ax|}{a} \qquad \int x\sin ax = \frac{\sin ax - ax\cos ax}{a^2}$$
$$\int e^{-x^2} = \frac{\sqrt{\pi}}{2}\mathrm{erf}(x) \qquad \int xe^{ax}dx = \frac{e^{ax}}{a^2}(ax-1)$$

Integration by parts:

$$\int_a^b f(x)g(x)dx = [F(x)g(x)]_a^b - \int_a^b F(x)g'(x)dx$$

3.6 Sums

$$c^a + c^{a+1} + \cdots + c^b = \frac{c^{b+1}-c^a}{c-1}, c \neq 1$$

$$1+2+3+\cdots+n = \frac{n(n+1)}{2}$$
$$1^2+2^2+3^2+\cdots+n^2 = \frac{n(2n+1)(n+1)}{6}$$
$$1^3+2^3+3^3+\cdots+n^3 = \frac{n^2(n+1)^2}{4}$$
$$1^4+2^4+3^4+\cdots+n^4 = \frac{n(n+1)(2n+1)(3n^2+3n-1)}{30}$$

3.7 Series

$$e^x = 1+x+\frac{x^2}{2!}+\frac{x^3}{3!}+\ldots, (-\infty < x < \infty)$$
$$\ln(1+x) = x-\frac{x^2}{2}+\frac{x^3}{3}-\frac{x^4}{4}+\ldots, (-1 < x \leq 1)$$
$$\sqrt{1+x} = 1+\frac{x}{2}-\frac{x^2}{8}+\frac{2x^3}{32}-\frac{5x^4}{128}+\ldots, (-1 \leq x \leq 1)$$
$$\sin x = x-\frac{x^3}{3!}+\frac{x^5}{5!}-\frac{x^7}{7!}+\ldots, (-\infty < x < \infty)$$
$$\cos x = 1-\frac{x^2}{2!}+\frac{x^4}{4!}-\frac{x^6}{6!}+\ldots, (-\infty < x < \infty)$$

3.8 Probability theory

Let X be a discrete random variable with probability $p_X(x)$ of assuming the value x. It will then have an expected value (mean) $\mu = \mathbb{E}(X) = \sum_x x p_X(x)$ and variance $\sigma^2 = V(X) = \mathbb{E}(X^2) - (\mathbb{E}(X))^2 = \sum_x (x - \mathbb{E}(X))^2 p_X(x)$ where σ is the standard deviation. If X is instead continuous it will have a probability density function $f_X(x)$ and the sums above will instead be integrals with $p_X(x)$ replaced by $f_X(x)$.

Expectation is linear:

$$\mathbb{E}(aX + bY) = a\mathbb{E}(X) + b\mathbb{E}(Y)$$

For independent X and Y,

$$V(aX + bY) = a^2V(X) + b^2V(Y).$$

3.8.1 Binomial distribution

The number of successes in n independent yes/no experiments, each which yields success with probability p is $\text{Bin}(n, p)$, $n = 1, 2, \ldots$, $0 \le p \le 1$.

$$p(k) = \binom{n}{k} p^k (1-p)^{n-k}$$

$$\mu = np,\ \sigma^2 = np(1-p)$$

$\text{Bin}(n, p)$ is approximately $\text{Po}(np)$ for small p.

3.8.2 First success distribution

The number of trials needed to get the first success in independent yes/no experiments, each which yields success with probability p is $\text{Fs}(p)$, $0 \le p \le 1$.

$$p(k) = p(1-p)^{k-1},\ k = 1, 2, \ldots$$

$$\mu = \frac{1}{p},\ \sigma^2 = \frac{1-p}{p^2}$$

3.8.3 Poisson distribution

The number of events occurring in a fixed period of time t if these events occur with a known average rate κ and independently of the time since the last event is $\text{Po}(\lambda)$, $\lambda = t\kappa$.

$$p(k) = e^{-\lambda}\frac{\lambda^k}{k!}, k = 0, 1, 2, \ldots$$

$$\mu = \lambda,\ \sigma^2 = \lambda$$

3.8.4 Exponential distribution

The time between events in a Poisson process is $\text{Exp}(\lambda)$, $\lambda > 0$.

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & x \ge 0 \\ 0 & x < 0 \end{cases}$$

$$\mu = \frac{1}{\lambda},\ \sigma^2 = \frac{1}{\lambda^2}$$

3.9 Prime Number

3.9.1 Distribution of Prime Number

1e2	25	1e6	78,498	1e10	<5e8
1e3	168	1e7	664,579	1e11	<5e9
1e4	1,229	1e8	<6e6	1e12	<4e10
1e5	9,592	1e9	<6e7	1e13	<4e11

3.9.2 Prime Gap

$2 \cdot 10^5$ 이하의 소수 간극 ≤ 100

2^{32} 이하의 소수 간극 ≤ 464

2^{64} 이하의 소수 간극 ≤ 1550

3.10 Miller-Rabin Algorithm

Usage: `is_p(X)` : returns true if X is prime, otherwise false.

When $X \le 2^{32}, D = \{2, 7, 61\}$ is sufficient;

$X \le 2^{64}, D = \{p | p \text{ is prime}, p \le 37\}$ is sufficient.

Time Complexity: $\mathcal{O}(\log^3 X)$

```
ll pow(ll a, ll b, ll mod) {
    ll ret = 1;
    for(int st=0; (1LL<<st) <= b; st++) {
        if((1LL<<st) & b) ret=(lll)ret*a%mod;
        a=(lll)a*a%mod;
    }
    return ret;
}
bool miller(ll n, ll a) {
    if(n == a) return true;
    ll x = n-1;
    if(pow(a, x, n) != 1) return false;
    while(x%2==0) {
        x/=2;
        ll t = pow(a, x, n);
        if(t!=1 and t!=n-1) return false;
        if(t==n-1) return true;
    }
    return true;
}
bool is_p(ll n) {
    if(n<=2) return n==2;
    vi D = {2, 3, 5, 7, 11, 13, 17, 23, 29, 31, 37};
    for(auto i:D) if(!miller(n, i)) return false;
    return true;
}
```

3.11 Pollad Rho Algorithm

Usage: `po_rho(N)` : returns array of prime factors of X.

Time Complexity: $\mathcal{O}(N^{1/4})$

```
void fact(ll n, vl& ret) {
    if(n == 1) return;
    else if(n%2 == 0) ret.pb(2), fact(n/2, ret);
    else if(is_p(n)) ret.pb(n);
    else {
        ll a, b, c, g = n;
        auto f = [&c, &n](ll x)->ll{return (c+(lll)x*x)%n;};

        do {
            if(g == n) a=b=rand()%(n-2)+2, c=rand()%20+1;
            a=f(a); b=f(f(b));
            g = gcd(a-b, n);
        } while(g == 1);
        fact(g, ret); fact(n/g, ret);
    }
```

```
}
vl po_rho(ll n) {
    vl ret;
    fact(n, ret);
    sort(all(ret));
    return ret;
}
```

3.12 Primitive Root

Usage: Calculate one of the primitive roots of given prime.

```
ll primary_root(ll p) {
    std::random_device rd;
    std::mt19937 gen(rd());
    std::uniform_int_distribution<ll> distrib(1, p-1);

    //distrib(gen);
    vl g = po_rho(p-1);

    while(true) {
        ll c = distrib(gen);

        bool ok = true; ll u = p-1;
        ll b = 1;
        for(auto i:g) {
            if(i != b) u = p-1;
            ll x = pow(c, u/i, p);
            if(x == 1) ok = false;
            u /= i; b = i;
        }

        if(ok) return c;
    }
}
```

3.13 Diopantos Equation(Extended Euclidian Algorithm)

Usage: `diophantos(a, b)` : return one integer solution of $ax+by = 1$, satisfying $0 \le x < b$.

Time Complexity: $\mathcal{O}(\log(\max(a,b)))$

```
pll diophantos(ll a, ll b) {
    assert(a>0 and b>=0);
    if(b == 0) return {1, 0};
    auto [y, x] = diophantos(b, a%b); y = y-(a/b)*x;
    if(x < 0 or x >= b) {
        ll t = x/b;
        if(x%b < 0) t--;

        x -= b*t; y += a*t;
    }
    return {x, y};
}
```

3.14 Chinese Remainder Theorem

Usage: `crt(pll p, pll q)` : return `pll r`, satisfying follows:

$$x \equiv \texttt{p.fi} \mod \texttt{p.se}$$
$$\text{and } x \equiv \texttt{q.fi} \mod \texttt{q.se}$$
$$\leftrightarrow x \equiv \texttt{r.fi} \mod \texttt{r.se}$$

If there's no such `r`, return $\{-1, -1\}$.

Time Complexity: $\mathcal{O}(\log A)$

```
pll crt(pll p, pll q) {
    if(p.fi > q.fi) swap(p, q);
    auto [a, A] = p;
    auto [b, B] = q;

    ll g = gcd(A, B);
    if((b-a)%g != 0) return {-1, -1};

    ll i = A, j = B, k = b-a;
    i/=g; j/=g; k/=g;
    auto [x, y] = diophantos(i, j);
    return {(ll)((a+(lll)A*k*x)%(A*B/g)), A*B/g};
}
```

3.15 Harmonic Lemma

Usage: `f(N)` : return the value

$$\sum_{i=1}^{N} \left\lfloor \frac{N}{i} \right\rfloor = \left\lfloor \frac{N}{1} \right\rfloor + \left\lfloor \frac{N}{2} \right\rfloor + \cdots + \left\lfloor \frac{N}{N} \right\rfloor$$

Using the fact that $\left\lfloor \frac{N}{x} \right\rfloor$ has $\mathcal{O}(\sqrt{N})$ different values.

Time Complexity: $\mathcal{O}(\sqrt{N})$

```
ll harmonic(ll n) {
    ll ans = 0;
    for(ll i = 1; i <= n; i = n/(n/i)+ 1) {
        //for j \in [i, n/(n/i)] : n/j == n/i

        ans += n/i * (n/(n/i) - i + 1);

        // \sum_{i=1}^n {f(n/i)}
        // ans += f(n/i) * (n/(n/i) - i + 1)
    }
    return ans;
}
```

3.16 Floor Sum (Sum of Floor of Rational Arithmetic Sequence)

Usage: `floor_sum(A, B, C, N)` : return the value

$$\sum_{x=0}^{N-1} \left\lfloor \frac{Ax+B}{C} \right\rfloor$$

Time Complexity: $\mathcal{O}(\log N)$

```
ll floor_sum(ll a, ll b, ll c, ll n)
{
    if(a == 0) return b/c*n;
    if(a>=c or b>=c) return n*(n-1)/2 * (a/c) + n * (b/c) +
    floor_sum(a%c, b%c, c, n);
    ll m = (a*(n-1)+b)/c;
    return m*n - floor_sum(c, c-b+a-1, a, m);
}
```

3.17 FFT - Convolution

Time Complexity: $\mathcal{O}(N \log N)$

```
using cpx = complex<double>;
using vcpx = vector<cpx>;
void fft(vcpx &a, bool inv = false) {
    int n = a.size(), j = 0; assert((n&-n) == n);
    for(int i=1; i<n; i++) {
        int bit = (n >> 1);
```

```
        while(j >= bit) {
            j -= bit; bit >>= 1;
        }
        j += bit; if(i < j) swap(a[i], a[j]);
    }
    vcpx roots(n/2);
    prec c = 2 * pi * (inv ? -1 : 1);
    for(int i=0; i<n/2; i++)
        roots[i] = cpx(cosl(c * i / n), sinl(c * i / n));

    for(int i=2, step = n/i; i<=n; i<<=1, step = n/i)
    for(int j=0; j<n; j+=i) for(int k=0; k<i/2; k++) {
        cpx u = a[j+k], v = a[j+k+i/2]*roots[step*k];
        a[j+k] = u+v;
        a[j+k+i/2] = u-v;
    }
    if(inv) for(int i=0; i<n; i++) a[i] /= n;
}

ll mod = 1e9+7;
vl conv(const vl& AA,const vl& BB) {
    const ll G = 1<<15;
    int n = AA.size()+BB.size()-1;
    int m = 1; while(m < n) m<<=1;
    int a = AA.size(), b = BB.size();

    vcpx A(m), B(m), C(m), D(m);
    fors(i, 0, a-1) A[i] = cpx(AA[i]/G, AA[i]%G);
    fors(i, 0, b-1) B[i] = cpx(BB[i]/G, BB[i]%G);

    fft(A); fft(B);
    fors(i, 0, m-1) {
        int j = i?m-i:0;
        cpx A1 = (A[i]+conj(A[j]))*cpx(0.5, 0);
        cpx A2 = (A[i]-conj(A[j]))*cpx(0, -0.5);
        cpx B1 = (B[i]+conj(B[j]))*cpx(0.5, 0);
        cpx B2 = (B[i]-conj(B[j]))*cpx(0, -0.5);

        C[i] = A1*B1 + A2*B2*cpx(0, 1);
        D[i] = A2*B1 + A1*B2*cpx(0, 1);
    }
    fft(C, true); fft(D, true);

    vl ret(m); ll G1 = G%mod, G2 = (lll)G*G%mod;
    fors(i, 0, m-1) {
        ll p = ll(C[i].real()+0.5);
        ll q = ll(D[i].real()+0.5) + ll(D[i].imag()+0.5);
        ll r = ll(C[i].imag()+0.5);

        p %= mod; q %= mod; r %= mod;
        ret[i] =
        (((lll)p*G2)%mod+((lll)q*G1)%mod+r%mod)%mod;
    }
    ret.resize(n);
    return ret;
}
```

3.18 NTT - Number Theoretic Transform

Usage: helloworld

```
namespace GMS {
template<ll mod>
ll pow(ll a, ll b) {
    a %= mod;
    ll ret = 1;
    while(b != 0) {
        if(b&1) ret = ret*a%mod;
        a = a*a%mod; b>>=1;
    }
    return ret;
}
template<ll mod, ll w>
void ntt(vector<ll> &a, bool inv = false) {
    static_assert(mod <= (ll)2e9, "mod should be less than
    2e9");
    int n = a.size(), j = 0;

    assert((n & -n) == n && (mod-1)%n == 0);

    for(int i=1; i<n; i++) {
        int bit = (n >> 1);
        while(j >= bit) {
            j -= bit;
            bit >>= 1;
        }
        j += bit;
        if(i < j) swap(a[i], a[j]);
    }

    static vector<ll> root[30], iroot[30];
    for(int st=1; (1<<st) <= n; st++) {

3.20 Combinatorics

3.20.1 Labeled Combinatorial Target

- Permutation, Combination (with, w/o repetition)
  - Permutation ${}_nP_r = \frac{n!}{r!(n-r)!}$
  - Combination ${}_nC_r = \binom{n}{k} = \frac{n!}{r!}$
  - Permutation with repetition ${}_n\Pi_r = n^r$
  - Combination with repetition ${}_nH_r = {}_{n+r-1}C_r$
- Catalan Number C_n : the number of regular bracket string of length $2n$.
  - $C_n = \frac{1}{n+1}\binom{2n}{n}$
  - $C_n : 1, 1, 2, 5, 14, 42, 132, 429, 1430, \cdots$ (from index 0)
  - OGF of C_n : $c(x) = 1 + xc(x)^2, c(c) = \frac{1-\sqrt{1-4x}}{2x}$
  - Catalan's triangle $C(n, k)$: the number of string with n X's, k Y's, where the number of Y's is not greater than the number of X's when written down the string.
    - i.e. $C(4, 3)$: XXXXYYY, XXYXYYX are OK, but XXYYYXX is not OK.
    - $C(n, k) = \binom{n+k}{k} - \binom{n+k}{k-1} = \frac{n-k+1}{n+1}\binom{n+k}{k}$
    - We can give the condition relax : $C_m(n, k)$: the number of string with n X's, k Y's, where the number of Y's is not greater than (the number of X's) + m when written down the string.
    - $C_m(n, k) = \binom{n+k}{k} - \binom{n+k}{k-m}$ when $m \leqslant k \leqslant n+m-1$.
    - $C_1(n, k) = C(n, k)$
- Derangement(교란순열) D_n : the number of permutation of length n which $\forall i\ p_i \neq i$.

  - D_n : $1, 0, 1, 2, 9, 44, 265, 1854, 14833, 133496, 1334961 \cdots$ (from index 0)
  - EGF of D_n : $D(x) = \sum_{n=0} \frac{D_n}{n!} x^n = \frac{e^{-x}}{1-x}$
- Stirling Number of the 1st/2nd kind.
  - Unsigned Stirling Number of the 1st kind $c(n,k) = \begin{bmatrix} n \\ k \end{bmatrix}$: the number of permutation of length n with k disjoint cycles.
    - $c(n+1,k) = n \times c(n,k) + c(n,k-1)$
    - with boundary condition $c(0,0) = 1, c(n,0) = c(0,k) = 0 \; \forall n,k > 0$
    - $c(n,k)$
      - $c(0,0) = 1$; $c(x_{\neq 0}, 0) = 0$; $c(x,x) = 1$
      - $c(x,x) = 1$
      - $c(5,*) = \{0, 24, 50, 35, 101\}$
      - $c(6,*) = \{0, 120, 274, 225, 85, 15, 1\}$
    - OGF of $\begin{bmatrix} n \\ k \end{bmatrix}$: for fixed n, $\sum_{k=0}^{n} \begin{bmatrix} n \\ k \end{bmatrix} x^k = x(x+1)(x+2)\cdots(x+n-1)$: we can calculate it by polynomial shift & divide and conquer
    - EGF of $\begin{bmatrix} n \\ k \end{bmatrix}$: for fixed k, $\sum_{n=k}^{\infty} \begin{bmatrix} n \\ k \end{bmatrix} \frac{x^n}{n!} = \frac{(-\log(1-z))^k}{k!}$
    - Signed Stirling Number of the 1st kind $s(n,k) = (-1)^{n-k} c(n,k)$
    - EGF of $s(n,k)$: for fixed k, $\sum_{n=k}^{\infty} s(n,k) \frac{x^n}{n!} = \frac{(\log(1+z))^k}{k!}$
  - Stirling Number of the 2nd kind $S(n,k) = \begin{Bmatrix} n \\ k \end{Bmatrix}$: the number of partition of n labeled objects into k nonempty unlabelled subsets.
    - $S(n,k) = \frac{1}{k!} \sum_{i=0}^{k} (-1)^{k-i} \binom{k}{i} i^n$
    - $S(n,k) = S(n-1,k-1) + k \cdot S(n-1,k)$
    - $S(n,k)$
      - $S(0,0) = 1$; $S(x_{\neq 0}, 0) = 0$; $S(x,x) = 1$
      - $S(5,*) = \{0, 1, 15, 25, 10, 1\}$
      - $S(6,*) = \{0, 1, 31, 90, 65, 15, 1\}$
    - OGF of $\begin{Bmatrix} n \\ k \end{Bmatrix}$: for fixed n, $\sum_{k=0}^{n} \begin{Bmatrix} n \\ k \end{Bmatrix} x^k = T_n(x)$, where $T_n(x) = e^{-x} \sum_{k=0}^{\infty} \frac{k^n}{k!} x^k$ is Touchard Polynomials.
    - EGF of $\begin{Bmatrix} n \\ k \end{Bmatrix}$: for fixed k, $\sum_{n=k}^{\infty} \begin{Bmatrix} n \\ k \end{Bmatrix} \frac{x^n}{n!} = \frac{(e^x-1)^k}{k!}$
- Bell Number B_n : the number of partition of set with size n.
  - i.e. partitionize $\{a,b,c\}$ is $\{\{a\},\{b\},\{c\}\}, \{\{a,b\},\{c\}\}, \{\{b,c\},\{a\}\}, \{\{c,a\},\{b\}\}, \{\{a,b,c\}\}$. Therefore, $B_3 = 5$.
  - B_n : $1, 1, 2, 5, 15, 52, 203, 877, 4140, \cdots$ (from index 0)
  - $B_n = \sum_{k=0}^{n} \begin{Bmatrix} n \\ k \end{Bmatrix}$ (2nd kind of stirling number)
  - EGF of B_n : $B(x) = \sum_{n=0} \frac{B_n}{n!} x^n = e^{e^x - 1}$
  - Ordered Bell Number(Fubini Number) a_n : the number of distinct weak ordering on a set of n elements.
    - a_n : $1, 1, 3, 13, 75, 541, 4683, 47293, 545835, 7087261, \cdots$
    - $a_n = \sum_{k=0}^{n} k! \begin{Bmatrix} n \\ k \end{Bmatrix}$ (stirling number of the 2nd kind)
    - EGF of a_n : $a(x) = \sum_{n=0}^{\infty} \frac{a_n}{n!} x^n = \frac{1}{2-e^x}$
- Integer Partition $P(n,k)$: the number of partitions of n into exactly k parts.
  - i.e. $P(4,2) = 2$ since $4 = 1+3 = 2+2$
  - we also say $P(n) = \sum_{k=1}^{n} P(n,k)$
  - $P(n,k)$
    - $P(x,1) = P(x,x) = 1$
    - $P(8,*) = \{1, 4, 5, 5, 3, 2, 1, 1\}$
    - $P(9,*) = \{1, 4, 7, 6, 5, 3, 2, 1, 1\}$
  - $P(n) = \{1, 2, 3, 5, 7, 11, 15, 22, 30, 42\}$
- 12정도(the Twelvefold Way) : the number of functions (Domain $|N| = n$, Codomain $|X| = x$)

    auto it = lower_bound(all(res), p{S[i], 0});
    if (it == res.end()) res.emplace_back(), it =
    res.end()-1;
    *it = {S[i], i};
    prev[i] = it == res.begin() ? 0 : (it-1)->second;
  }
  int L = sz(res), cur = res.back().second;
  vi ans(L);
  while (L--) ans[L] = cur, cur = prev[cur];
  return ans;
}
```

7.2 DP Optimization

7.2.1 Convex Hull Optimization

Recurrence : $D[i] = \min_{j<i} (B[j] \times A[i] + D[j])$

Complexity : $\mathcal{O}(N^2) \to \mathcal{O}(N \log N)$

7.2.2 Divide and Conquer Optimization

Recurrence : $D[i][j] = \min_{k<i} (D[i-1][k] + C[k][j])$

Condition : $C[i][j]$ is Monge

(if $a \leqslant b \leqslant c \leqslant d$, then $C[a][c] + C[b][d] \leqslant C[a][d] + C[b][c]$)

Complexity : $\mathcal{O}(KN^2) \to \mathcal{O}(KN \log N)$

```
//D[t][s...e]를 구해야 하고, j의 탐색 범위는 [l, r]
void f(int t, int s, int e, int l, int r){
    if(s > e) return;
    int m = s + e >> 1;
    int opt = l;
    for(int i=l; i<=r; i++){
        if(D[t-1][opt] + C[opt][m] > D[t-1][i] + C[i][m])
        opt = i;
    }
    D[t][m] = D[t-1][opt] + C[opt][m];
    f(t, s, m-1, l, opt);
    f(t, m+1, e, opt, r);
}
```

7.2.3 Monotone Queue Optimization

Recurrence : $D[i] = \min_{j<i} (D[j] + C[j][i])$

Condition : $C[i][j]$ is Monge

Complexity : $\mathcal{O}(N^2) \to \mathcal{O}(N \log N)$

7.2.4 Knuth's Optimization

Recurrence : $D[i][j] = \min_{i \leqslant k < i} (D[i][k] + D[k+1][j]) + C[i][j]$

Condition : $C[i][j]$ is Monge &

$C[a][d] \geqslant C[b][c]$ for $a \leqslant b \leqslant c \leqslant d$

Complexity : $\mathcal{O}(N^3) \to \mathcal{O}(N^2)$

구간에 대해 동적 계획법(DP)을 수행할 때, 다음과 같은 점화식이 있다고 가정합니다:

$$a[i][j] = \min_{i<k<j} \left(a[i][k] + a[k][j]\right) + f(i, j)$$

여기서 (최소화된) 최적의 k가 i와 j 모두에 대해 증가한다고 하면, 구간의 길이에 따라 DP를 계산하며 $a[i][j]$에 대해 $k = p[i][j]$를 $p[i][j-1]$부터 $p[i+1][j]$ 사이에서만 탐색하면 됩니다.

7.2.5 Aliens Trick (Lagrangian relaxation)

Recurrence : $D[k][i] = \min_{j<i}(D[k-1][j] + C[j+1][i])$

Condition : $D[x][N]$ is convex (is implied when $C[i][j]$ is Monge)

$$(f(x+1) - f(x) \leqslant f(x+2) - f(x+1))$$

Complexity : $\mathcal{O}(KN^2) \to \mathcal{O}(N^2 \log |W|)$

7.2.6 Slope Trick

13323 BOJ 수열 1/2. 수열 A가 주어진다. 증가수열 B에 대해, $\sum_{i=1}^{N} |A_i - B_i|$를 최소화하고, 그 B를 찾아라.

```
const int N = 1e6+7;

8 String

8.1 KMP

```
int fail[N]; // N : s의 최대 길이
vi kmp(char obj[], char s[]) {
    vi ret;
    for(int i = 1, j = 0; s[i]; i++) {
        fail[i] = 0;
        while(j > 0 and s[i] != s[j]) j = fail[j-1];
        if(s[i] == s[j]) fail[i] = ++j;
    }
    for(int i = 0, j = 0; obj[i]; i++) {
        while(j > 0 and obj[i] != s[j]) j = fail[j-1];
        if(obj[i] == s[j]) {
            if(s[j+1]) j++;
            else ret.push_back(i-j), j = fail[j];
        }
    }
    return ret;
}
```

8.2 F, Z, M, SA(Suffix Array), LCP(Longest Common Prefix)

Usage: For string s(1-indexed) of length N;

F[i] = maximum $k < i$ s.t. $s[1 \dots k] = s[i-k+1 \dots i]$

Z[i] = maximum k s.t. $s[1 \dots k] = s[i \dots i+k-1]$

M[i] = maximum k s.t. $s[i-k+1 \dots i+k-1]$ is palindrom.

SA[i] = k s.t. $s[k \dots N]$ is the i^{th} smallest of $\{s[1 \dots N],\ s[2 \dots N],\ \cdots,\ s[N \dots N]\}$

LCP[i] = maximum k s.t. $s[SA[i-1] \dots SA[i-1]+k-1] = s[SA[i] \dots SA[i]+k-1]$

Time Complexity: $\mathcal{O}(N), \mathcal{O}(N), \mathcal{O}(N), \mathcal{O}(N \log N), \mathcal{O}(N)$, respectively

```
const int N = 1e5+7;
char s[N];
int F[N], Z[N], M[N];

        now = trie[now].next[s[i]-'a'];
        if(trie[now].isfin) ok = true;
    }
}
```

8.4 Eertree

```
struct Eertree {
    int len[N], link[N], nxt[N][26], r[N];
    long long cnt[N]; int sz, last, n;
    char s[N];
    Eertree() {
        memset(nxt, 0, sizeof(nxt));
        memset(cnt, 0, sizeof(cnt));
        s[0] = -1;
        n = 0; sz = 2; last = 1;
        len[0] = -1; link[0] = 0;
        len[1] = 0; link[1] = 0;
    }
    int get_link(int v) {
        while (s[n-len[v]-1] != s[n]) v = link[v];
        return v;
    }
    void insert(char c) {
        s[++n] = c;
        int cur = get_link(last);
        if (!nxt[cur][c-'a']) {
            int now = sz++;
            r[now] = n;
            len[now] = len[cur] + 2;
            if (len[now] == 1) link[now] = 1;
            else link[now] =
            nxt[get_link(link[cur])][c-'a'];
            nxt[cur][c-'a'] = now;
        }
        last = nxt[cur][c-'a'];
        cnt[last]++;
    }
    void propagate() { fore(i, sz-1, 2) cnt[link[i]] +=
    cnt[i]; }
```

```
};

Eertree et; forr(i, n) et.insert(s[i]);
int m = et.sz; et.propagate();
fors(i, 2, m-1) ans = max(ans, et.cnt[i] * et.len[i]);
// node i : s[(et.r[i]-et.len[i]+1)~(et.r[i])]
// distinct count of pal : m-2; count of node i : et.cnt[i];
```

9 Graph

9.1 SCC - Tarjan Algorithm

Usage: `scn[i]` : SCC number of node i, `nscc` : the number of SCCs

```
vi adj[N];
int in[N], c = 0;
stack<int> p;
bool fin[N]; int scn[N], nscc = 0;
int dfs(int s) {
    in[s] = ++c;
    p.push(s);

    int m = c;
    for(auto i : adj[s]) {
        if(in[i] == 0) m = min(m, dfs(i));
        else if(!fin[i]) m = min(m, in[i]);
    }

    if(m == in[s]) {
        nscc++;
        while(p.top() != s)
        {
            int i = p.top(); p.pop();
            scn[i] = nscc; fin[i] = true;
        }
        p.pop();
        scn[s] = nscc; fin[s] = true;
    }
    return m;
}

forr(i, n) if(!fin[i]) dfs(i);
```

9.1.1 2-SAT

Usage: For all $(x||y)$ clause, make the edge from $!x$ to y, and from $!y$ to x, and then find the SCC from graph. Check whether for all x, x and $!x$ are not in the same SCC. To reconstruct the 2-SAT, make it false for x or make it true for $!x$ if we can, in decreasing order of scn.

```
ok = true; // 1<=i&&i<=n : $x$, n+1<=i&&i<=2*n : $!x$
forr(i, n) {
    if (scn[i] == scn[i+n]) ok = false;
    ans[i] = (scn[i] < scn[i+n]);
}
```

9.2 Bipartite Matching - with DFS

Usage: Let's say that graph is bipartite. And Let's say that one group is A, and the other graph is B. $|A| = N$, $|B| = M$. `matching(c = s)` : add one matching from $s \in A$. If successfully matched, return true; otherwise return false. `selby[i] =` store $s \in A$, s.t. $i \in B$ is matched with s.
(e.g.) `forr(i, n) ans += matching(c=i);`

Time Complexity: $\mathcal{O}(VE)$

```
vector<int> sideadj[N];
int selby[M];
int chk[M], c;
bool matching(int s) {
    for(auto i : sideadj[s]) {
        if(chk[i] == c) continue;
        chk[i] = c;
        if(selby[i] and !matching(selby[i])) continue;
        selby[i] = s;
        return true;
    }
    return false;
}
```

9.2.1 Hall's Marriage Theorem

For some bipartite graph $G = (A \cup B, E)$, G has perfect matching if and only if for every $S \subseteq A$, $|N_G(S)| \geqslant |S|$ holds.

9.2.2 Minimum Vertex Cover on Bipartite Graph(Kőnig's Therorem)

On bipartite graph,

$$|\texttt{Minimum Vertex Cover}| = |\texttt{Maximum Matching}|$$

To find Minimum Vertex Cover, (Should be **added**.)

9.2.3 Maximum Independent Set on Bipartite Graph

On bipartite graph,

$$|\texttt{Maximum Independent Set}| = |V| - |\texttt{Maximum Matching}|$$

* Note : Complement of the Vertex Cover is the Independent Set.

9.2.4 Minimum Path Cover on DAG

Let's think about the bipartite graph, with vertex set A and B, satisfying follow property:

- If there's edge from node i to node j on DAG, then there's edge connecting i^{th} node of A and j^{th} node of B, and vice versa.

Then following holds:

$|\texttt{Minimum Path Cover of DAG}| = |\texttt{Maximum Matching on Bipartite Graph}$

9.2.5 Maximum Antichain on DAG(Dilworth's Theorem)

On DAG,

$$|\texttt{Minimum Path Cover}| = |\texttt{Maximum Antichain}|$$

9.3 Dominator Tree

Usage: For directed graph $G = (V, E)$ and some vertex $s \in V$ which can reach every vertex in V, u is domonator of v iff $u \neq v$ and every path from s to v must go through u. Dominator tree is the tree that connects idom(v)(Immediate Dominator) and v.

```
// https://ideone.com/a06cH4
namespace dtree{  // by cki86201
vector<int> E[N], RE[N], rdom[N];
int S[N], RS[N], cs;

    RS[ S[x] = ++cs ] = x;
    par[cs] = sdom[cs] = val[cs] = cs;
    for(int e : E[x]) {
        if(S[e] == 0) dfs(e), rp[S[e]] = S[x];
        RE[S[e]].push_back(S[x]);
    }
}
int solve(int s, int *up) { // Calculate idoms
    dfs(s);
    for(int i=cs;i;i--) {
        for(int e : RE[i]) sdom[i] = min(sdom[i],
        sdom[Find(e)]);
        if(i > 1) rdom[sdom[i]].push_back(i);
        for(int e : rdom[i]) {
            int p = Find(e);
            if(sdom[p] == i) dom[e] = i;
            else dom[e] = p;
        }
        if(i > 1) Union(i, rp[i]);
    }
    for(int i=2;i<=cs;i++) if(sdom[i] != dom[i]) dom[i] =
    dom[dom[i]];
    for(int i=2;i<=cs;i++) up[RS[i]] = RS[dom[i]];
    return cs;
}
} // namespace dtree

int par[N];
dtree::add_edge(a, b); // a -> b
int cnt = dtree::solve(s, par);
// cnt : s에서 도달할 수 있는 정점, par: dominator tree의 par
```

9.4 Network Flow - Dinic

Usage: Construct graph with `connect(from, to, capacity, isDirected);`. Find the flow from S to T with `flow(S, T);`.

Time Complexity: $\mathcal{O}(V^2E)$, but it works like magic.

```
struct Edge {
    int to, cap, now;
    Edge* rev;
    Edge(int to,int cap):to(to), cap(cap), now(0){}
    int left(){return cap - now;}
    void flow(int f){now += f; rev->now -= f;}
    void reset(){now = 0;}
};
vector<Edge*> adj[N];

int lv[N]; bool chk[N];
bool bfs(int S, int T) {
    queue<int> q;
    q.push(S); lv[S] = 0; chk[S] = true;
    while(!q.empty()) {
        int s = q.front(); q.pop();
        for(auto i : adj[s]) {
            if(i->left() and !chk[i->to]) {
                lv[i->to] = lv[s]+1; chk[i->to] = true;
                q.push(i->to);
            }
        }
    }
    return chk[T];
}

Edge* hist[N]; int last[N];
bool dfs(int s, int T) {
    if(s == T) return true;

    for(int &j=last[s]; j < adj[s].size(); j++) {
        int i = adj[s][j]->to;
        if(adj[s][j]->left() == 0 or lv[i] != lv[s]+1)
        continue;
        hist[i] = adj[s][j];

        if(dfs(i, T)) return true;
    }
    return false;
}

ll flow(int S,int T) {
    ll ans = 0;
    while(bfs(S, T)) {
        while(dfs(S, T)) {
            int m = 2e9;
            int now = T;
            while(S != now) {
                m = min(m, hist[now]->left());
                now = hist[now]->rev->to;
            }
            now = T;
            while(S != now)
                hist[now]->flow(m), now =
                hist[now]->rev->to;
            ans += m;
        }
        memset(last, 0, sizeof last);
        memset(chk, 0, sizeof chk);
    }
    return ans;
}
// isDir : isDirected => 양방향 간선이면 false
void connect(int from, int to, int cap, bool isDir = true) {
    Edge *fw, *bw;
    fw = new Edge(to, cap);
```

```
    bw = new Edge(from, !isDir ? cap : 0);
    fw->rev = bw; bw->rev = fw;
    adj[from].push_back(fw);
    adj[to].push_back(bw);
}
```

9.5 MCMF - with SPFA

Usage: Construct graph with `connect(from, to, capacity, cost);`. Find the maximum flow and corresponding minimum cost from S to T with `flow(S, T);`.

Time Complexity: $\mathcal{O}(VEf)$, but it works like magic.

```
struct Edge {
    int to, cap, now;
    ll cost;
    Edge* rev;
    Edge(int to,int cap, ll cost)
        :to(to), cap(cap), now(0), cost(cost){}
    int left(){return cap - now;}
    ll flow(int f)
        {now += f; rev->now -= f; return cost * f;}
    void reset(){now = 0;}
};
vector<Edge*> adj[N];
Edge* hist[N]; ll dist[N]; bool inQueue[N], chk[N];
bool spfa(int s, int t) {
    memset(dist, 0, sizeof(dist));
    memset(chk, 0, sizeof(chk)); chk[s] = true;
    queue<int> q;
    memset(inQueue, 0, sizeof(inQueue));
    q.push(s); inQueue[s] = true;
    while(!q.empty()) {
        int now = q.front();
        q.pop(); inQueue[now] = false;

        for(auto e : adj[now]) {
            int next = e->to;
            if(e->left() > 0 and
                  (chk[next] == false

```

9.6 General Matching

Usage: We can use Tutte matrix. First, select arbitrary prime p. Second, construct $T_{i,j} = \begin{cases} r_{i,j} & \text{if } (i,j) \in E \text{ and } i < j \\ -r_{j,i} & \text{if } (i,j) \in E \text{ and } i > j \\ 0 & \text{otherwise} \end{cases}$, with $r_{i,j}$ be the random integer in $[1, p-1]$. After construct T, the maximum size of G is $\text{rank}(T)/2$ with high probability.

If we want the result of matching, use:

Time Complexity: $O(n^3)$

```

12 Numerical Analysis

13 Technic

13.1 Cartesian Tree

```
int A[N], par[N];
stack<int> st;
forr(i, n) {
    int l = -1;
    while(!st.empty() && A[st.top()] < A[i])
        l = st.top(), st.pop();
    if(l != -1) par[l] = i;
    if(!st.empty()) par[i] = st.top();
    st.push(i);
```

```
}

while(st.size() != 1) st.pop();
par[st.top()] = st.top();
```

14 Misc

14.1 Negative Division on C/C++

Usage: Procedure : (1) make both dividend and divisor positive, and calc the quotient (2) decide the sign of quotient, and calc r as $a - b \times q$. Following shows the floored division, not the truncated division.

```
#define div _div
ll div(ll A, ll B)
{
    ll q = A/B;
    if(A<0) q-=(B>0)-(B<0);
    return q;
}
```

14.2 Fast Input

Usage: Fast Input with fread. Do not use with scanf, cin, or other input function. Use `forr(i, n) read(arr[i]);` instead of `forr(i, n) scanf("%d", arr+i);`. Use `read(s+1)` instead of `scanf("%s", s+1);`.

```
#define getint(n) int n; read(n)
#define getll(n) ll n; read(n)
#define inta getint(a)
#define intab getint(a); getint(b)
char get() {
    static char buf[100000], *S=buf, *T=buf;
    if(S == T) {
        S = buf; T = buf + fread(buf, 1, 100000, stdin);
        if(S == T) return EOF;
    }
    return *S++;
}
void read(int& n) {
    n = 0; char c; bool neg = false;
    for(c = get(); c < '0'; c=get()) if(c=='-') neg = true;
    for(;c>='0';c=get()) n = n*10+c-'0';
    if(neg) n = -n;
}
void read(ll& n) {
    n = 0; char c; bool neg = false;
    for(c = get(); c < '0'; c=get()) if(c=='-') neg = true;
    for(;c>='0';c=get()) n = n*10+c-'0';
    if(neg) n = -n;
}
int read(char s[]) {
    char c; int p = 0; while((c = get()) <= ' ');
    s[p++] = c; while((c = get()) >= ' ') s[p++] = c;
    s[p] = '\0'; return p;
}
```

14.3 MT19937 Random Number

```
const long long rand_L = 1;
const long long rand_R = 10;
mt19937_64
rng(chrono::steady_clock::now().time_since_epoch().count());
uniform_int_distribution<int> dist(rand_L, rand_R);
auto gen = bind(dist, rng);

gen(); gen(); gen();
```
